IT Systems Administrator | Katalyst Space Technologies

Cover letter

Hi Katalyst team,

I call myself a technomancer. Technology has felt like magic to me since I was a kid, but the part I enjoy most is making complicated systems useful to other people. That often means owning the unglamorous work: tracing an access problem, understanding a dependency and leaving the next person a clearer path.

Katalyst's focus on building the foundations for sustained space operations caught my attention. Your IT role has a similar responsibility inside the company: give people dependable systems while the organization grows and the requirements become more demanding. That mix of hands-on work, craftsmanship and real ownership fits how I like to work.

At FRII, I ran the NOC and handled engineering escalations for hosting, server and colocation customers. I built tooling for operations teams and worked across Windows and Linux, virtualization, Docker and AWS. I also ran the SOC 1 and SOC 2 audits and later held sole systems-engineering responsibility for about a year. Keeping the service running, understanding the evidence behind a control and communicating a change were connected responsibilities, not separate specialties.

Through Technomancy IT, I still carry client needs from investigation into implementation and direct support. For Excell Services, I modernized servers and employee computers, implemented Windows Server, Active Directory and VPN access, and helped bring a satellite location online. My broader work includes Entra ID and AWS IAM integrations, tenant-aware access boundaries and more than five years supporting Azure client environments.

I also care about the handoffs around the technology. At Office Evolution, I connected provisioning, onboarding and service operations across locations, working with the CEO and CIO. Today, my own operational tooling connects customer and infrastructure context and includes release-health and backup-restore checks.

I would bring that combination of practical support, systems judgment and curiosity to your IT and Security team. I'm comfortable learning an unfamiliar environment, asking what matters and taking responsibility for making it work. I would welcome the chance to do that alongside people building something ambitious at Katalyst.

Chad
